Practical Machine Learning Course Project

D. Cucchiara

2022-07-27

Project Overview

Personal fitness trackers are commonly used to track individual fitness data. Users can quantify how much of a particular movement they make, but not how well they did the movement. This analysis will use accelerometer data from six participants. Accelerometers were worn on the belt, forearm, arm or on a dumbell. Participants were instructed to perform dumbell bicep curls (10 reps) incorrectly and correctly, in five different ways. I will use the data to predict the manner in which they did the exercise.

Data Preparation

Load necessary packages

```
library(lattice)
library(ggplot2)
library(caret)
library(kernlab)
library(rattle)
library(reshape2)
library(corrplot)
library(ggcorrplot)
library(randomForest)
library(rpart)
set.seed(3232)
```

load the test and training data

```
trainData <- read.csv("./pml-training.csv")
testData <- read.csv("./pml-testing.csv")
dim(trainData)

## [1] 19622 160
dim(testData)</pre>
```

```
## [1] 20 160
```

Data cleaning - Here, variables with nearly zero variance or that are almost always NA, and the columns containing summary statistics or irrelevant data will be removed.

```
trainClean <- trainData[,colMeans(is.na(trainData))< .9]
trainClean <- trainClean[,-c(1:7)]
nvz <- nearZeroVar(trainClean)
trainClean <- trainClean[,-nvz]
dim(trainClean)</pre>
```

```
## [1] 19622 53
```

Performed correlation matrix, see appendix, fig 1. The correlation matrix shows there are variables that are correlated, which must be removed

```
c <- findCorrelation(corMat, cutoff = .90)
trainClean <- trainClean[,-c]</pre>
```

Split the data into training (70%) and validation (30%)

```
inTrain <- createDataPartition(y=trainClean$classe, p=0.7, list=FALSE)
train <- trainClean[inTrain,]
valid <- trainClean[-inTrain,]
# Create a control for 3 fold validation
control <- trainControl(method="cv", number=3, verboseIter = FALSE)</pre>
```

Building the models

Random Forests

```
# Fit the model on train using random forest
train$classe <- factor(train$classe)</pre>
RFfit <- randomForest(classe~., data=train, method="class", trControl = control, tuneLength = 5)</pre>
RFfit
##

```

The estimated accuracy is 0.7499, and oos error is 0.2501

Selecting the most accurate method to use on the test set.

Random forests method was 99.37% accurate. Decision trees method was 58.69% accurate, and Support Vector Machine method was 74.99% accurate. In this case the data indicates that the most accurate model for predicting our test set is Random Forest

Predicting the test data set
